GLOBAL WARMING

by:
Rose Ann B. Guintu

The destiny of the Earth is to die? Do you agree with it? What do you think is the reason why there are people looking for another planet where life can exist? This is very alarming, nowadays Earth increasing temperature was already felt in the different parts of the world.

Global warming is the term used to describe a gradual increase in the average temperature of the Earth’s atmosphere, this change is believed to be permanently causes changes in the Earth’s climate. The increased volumes of carbon dioxide and other greenhouse gases released by the burning of fossil fuels, chemicals released by the different factories, deforestation, loss of biodiversity and other human activities are believed to be the primary causes of the global warming.

Vehicle can affect climate by releasing carbon dioxide when fossil fuels are burned to power them. When wildfires occur, carbon dioxide is released into the atmosphere, that is the reason why burning garbage in the house must be prohibited to lessen the amount of carbon dioxide in the atmosphere. Human’s comfort and security have resulted in adverse effects on environment, particularly since the industrial revolution.

The environment is forced to transform more rapidly. This caused climate change, depletion of ozone, rising of sea level, which can affect the entire life and life support systems existing on Earth. The continuous increased of the temperature of the Earth has great effects on the Earth’s climate patterns and on all living things. Our modern civilization depends on industrial activities which lead into increased of atmospheric carbon dioxide. Scientists predicted that global warming will continue to rise for decades to come especially due to greenhouse gases produced by human activities.

We need to do something to lessen the global warming and its effects on climate change. Some people say that the destiny of the earth is to become hotter, if that will happen, living things on earth would become extinct due to the high temperature. If
human will be aware and concern on global warming, it can help a lot to lessen the production of carbon dioxide in the atmosphere, because there is a big chance that people will do to help our mother earth, for instance planting of trees will be a big help in lessening the amount of carbon dioxide, because it will absorb by the trees. If everybody as one takes stand and try to control the causes of global warming that bring climate change, the Earth would be a safe place to live in.
