INFORMATION COMMUNICATION TECHNOLOGY IN EDUCATION
by: Marianne B. Loresco

It’s a fact that the only thing in this world that we can’t change in the word “change” is the word itself. In this modern days, if we are not updated with the fast changing technology, we’ll be left behind. The same is true with education, Information Communication Technology in education is geared towards promoting better access to quality education. It brings creative approaches towards a wide range of areas involving education from school administration to teaching in the classroom.

ICT provides key teaching and learning strategies that serve to enhance the educational experience of students. Incorporating ICT in the classroom allows pupils to learn in new and more profound ways. In the area of school administration, the use of computers and information systems has contributed to a more effective management of the school. There is also the added benefit of having students become more knowledgeable with the use of technology.

While ICT provides decidedly significant benefits, in itself it cannot be expected to provide the answers to the woes of our educational system. It is important to note, that for all the promise ICT in education brings, it is not a magic card or a magic wand that can be waved to solve the country’s educational problems.

In addition to this, the partnership of ICT and Education is one of the DepEd programs to promote quality education. The program includes the donation of computers, teacher training and website-content modules for learning.

Former Secretary Lesli Lapuz once said, “the world has become a global community wherein information and communication technology plays a vital role. “If we are to produce globally competitive graduates who will be the frontrunners in the country’s economic development, we will need to train them in the same playing field as the rest of their counterparts.
This project can be a great help not only for our students but also to the teachers. Considering the fact that we are now in the internet age and there’s a great necessity for ICT education in order to cope with the fast changing world. In totality, this project will give and equip our students and teachers as well as the knowledge and skills to be used as we face the globalization and to compete globally.
