Every day new gadgets, different website, exciting online games, and a variety of means to get connected with other people were discovered and introduced to the public. People get acquainted and informed about these changes through the use of the internet: the fastest way to get connected with the world.

Nowadays most of the people have an internet connection. As a result, the internet has become the handy best friend of the students, we can bring them anywhere. It is like we already become dependent on the internet because it can help us in many ways and we cannot live without the internet. It is now part of our lives. The partnership of ICT and Education is one of the DepEd programs to promote quality education. The pilot program includes the donation of computers, teacher training and website content modules for learning.

According to former DepEd Secretary Jesli Lapus, “the word has become a global community wherein information and communication technology plays a vital role. If we are to produce globally competitive graduates who will be the frontrunners in the country’s economic development, we will need to train them in the same playing field as the rest of their counterparts.

This project can be a great help not only for our students but also to the teachers. Considering the fact that we are now in the internet age and there’s a great necessity for ICT education in order to cope with the fast changing world. Students can access the internet and at the tip of their finger, they conquer all the source of information in the whole world using the internet. We all know that computers with an internet
connection can access us the world library. But sometimes, the effects may not always be good. Using the internet may have advantages and disadvantages. Since we cannot control the information, we should monitor our children in using it because it may be abused. In totality, the effects of this project will give and equip our students and teachers as well, the knowledge and skills to be used as we face the globalization and to compete globally.
