INNOVATIVE TECHNOLOGY

by:
Marfin Lojie R. de Jesus
Administrative Assistant II, Pablo Roman National High School

Technology is one of the most important informative sources of today’s learners through cellphones, laptops, computers, and projectors and by researching you will find that what you are looking for necessary information. In short technology helps us because it facilitates a variety of human activities

Much of the technology invented since the centuries ago. For example this is the computer only if you can get it right, he'll learn and research the things you want to know or need in school. But in modern times today, the most comprehensive and basic instrument used in education is computers that can access the internet. The Internet is more important because without the internet you cannot use the importance of knowledge or you cannot find what you are looking for. Students can effectively share their lesson because of the internet. The simple projector is used in teaching. It has the ability to grow images to better reflect the examples of illustration. The importance of the projector has helped teachers reflect and share his lesson.

Over time we had so-called 'globalization', and our technology continues to rise and develop. And with the rapid advancement of technology we can be said to be in line with the development and technological innovation of the developing country. Innovative technology is a part of one's daily life. We use technology almost everywhere. Computers, laptops, cellphones, GPS systems, smart boards and more. All of that came from technology. It helps us every day, by providing us with information and a comfortable life. Technology is fast and it helps our economy.
Due to modern technology, it has become easier to discover relevant information at anytime and anywhere. This has been made possible by modern technologies such as broadband internet. Information is the power, and people who find information and use it well, will always succeed. Innovative technology encourages innovation and creativity. In the past, it was difficult to start a business. Now, starting a business is just so easy and you can have a business while you're just at home.

Computer helps our students greatly in the research and discovery aspects. You don't have to mix lean books to get some creepy information in every book. You do not need to venture into dusty libraries to find the data needed in your homework. Just go Google, just encode the top you are looking for, just wait a moment, and you'll find what you're looking for. Many young people learn to use innovative technologies to develop. They also use these technologies in education.

I can say that technology is a great help in the development of various aspects of knowledge and education. But we need to remember that we should use it properly. Let's not abuse technology. It can cause us bad effects when it is used in the wrong way, but instead used technology for the better!
