LEARNING MATH THE EASY WAY
Written by: Odielon O. Gamboa, OIC-Assistant SHS Principal
Luakan National High School

How can a teacher teach a student if they do not know the things they are going to teach? Sometimes, it is difficult to teach “OVER THEIR HEAD” because it will be difficult to motivate and get their attention again. Once they started to lose it, it will be very hard for them to bring them in the class. So in order to make it light, here are some tips that will surely be of help most especially if you follow it by the heart.

To learn Math easily does not mean 1, 2, 3. This means that everything that a student must learn must be of sense to them because if it does not make sense to them, it will be very difficult for them to know what the things you are trying to tell. Even if they eventually do, still, it will not stay long in their memory and they cannot master it because they are not consistently doing it. So in order for them to learn it the easy way is to practice it until they will learn to do it on their own because once they can master it, they can easily illustrate it by themselves if called upon to do so.

A teacher’s goal must be to ensure that a student understand fully what they need to know in the “REAL WORLD” rather than focus on what is found in a textbook.

As a teacher, you are in charge whenever you come and enter your class so that you can determine the order in which you teach and the tools you must use in teaching them. Visuals will always make sense because you can see the why and how in front of you.

Lastly and definitely the last, make it sure that every student will become happy whenever you teach Math because having a harmonious relationship with them will be the best way to reach out for them, understand and help them to learn inside the class.
