MANGROVE: A PARADISE TO MAINTAIN

by:
Rodilfa C. Gonzales

Is mangrove really a paradise to maintain? Mangrove is a kind of tree that is very rich with biodiversity. It is the home of many creatures that contributes a lot to the beauty of our nature. It is the breeding ground for most marine animals, birds, insects, worms, crocodiles and other reptiles, and other creatures that benefits the mangrove forest. Mangrove helps most of the people living nearby the coastal area in sustaining their everyday living. It also protects the coastal area from big waves due to strong typhoon.

As stated by the Conservation International: Mangroves are tropical trees that thrive in conditions most timber could never tolerate — salty, coastal waters, and the interminable ebb and flow of the tide. Conservation International added: With the ability to store vast amounts of carbon, mangrove forests are key weapons in the fight against climate change, but they are under threat worldwide.

Most of the mangrove in coastal areas are now threatened because of some relocations, building constructions and other developmental purposes. We must bare in mind that there is life in mangrove forest that makes it a paradise that’s why we must protect, conserve and maintain the beauty of our mangrove forest.

As quoted by Conservation International: Nature doesn’t need people. People need nature. Conservation International added: Our food, our water, our health, our jobs — they all rely on the health of the planet’s ecosystems.
We need to protect, conserve and replant mangrove in order to maintain the paradise in our coastal areas for the future generation.
