NEW WAY OF TEACHING AMIDST PANDEMIC

by:
Dan Joseph D. Rafael
Teacher I, Alangan Elementary School

We have probably heard of the demand and application of new technologies nowadays in the teaching-learning situation since Covid-19 affected the whole world. ICT or Information and Communication Technology provide the means to allow, access, organize, manipulate and communicate information by electronic and other automated means. In school, we need to upgrade the level of ICT usage so as to adapt with the present trend of education. Teachers also need training and workshop to become expert/literate in this area. It will surely take time, more training and seminars, they must be patient and willing to learn to cope up with the modern process of teaching.

Often, ICT activities are introduced in schools first as extra curricular activities. For example, lessons are usually delivered using the board and chalk then it will be transferred to a new medium like power point presentation or sometimes it is projected through the use of computers or an LCD projector. Thru this way, learners become more interested in their classes and participate actively. The purpose of applying modern technology is not only instructional but also to break the monotony in teaching.

It can now be said that ICT has been fully integrated into the curriculum both in public and private schools and based on observations, it helped a lot to improve instructions. Thus, the complexity of a fully integrated ICT implementation in schools need to be strengthen. The government should find ways to provide the needs of all schools and more trainings must be given to both the teachers and learners to know much about ICT. They need seminars in using zoom meetings, google class and other platforms since its so hard to have face-to-face class during the pandemic.
Reflect on the situation of our school today and you will see the importance of ICT in our day to day activity.
