HOW TO ASSIST UNDERACHIEVER STUDENTS

by:
Mark Anthony C. Bautista
Teacher III, Sabatan Elementary School

One of the things that interfere with students learning is the study skill problem. Typical study skill problems include failure to complete assignment, poor attention during lecture or class discussion, failure to follow direction and poor management study time.

In this kind of problem, a teacher must fully devote himself / herself to develop his/her creative abilities to find ways of solving such kind of problems and how to approach that situation. However, no teachers is able to treat all students exactly alike, some may require a different type of instruction or additional attention from the teacher. Thus, differential treatment of students is often concern to teachers.

Effective learning happens when teacher are engaged in doing rather than listening, students can interact with the teacher and the learning materials. Another factor that hinders learning are inappropriate classroom behavior of pupils which are talking out, fight, arguing, being out of one’s seat and others. To alleviate these problems the teacher set ups a systematic programs to increase the occurrence of appropriate behaviors or to help pupils generalize behaviors from one situation to another.

Teaching is not solely about filling the listener’s mind information it is also about helping them apply it to their lives. Helping the students to realize how important to learn and can make them motivated. That is why it is important to link the lesson to real – world learning. When children do not see the importance of what you are teaching, you must point out to them the value of what they are learning.
