SCIENCE IN THE EYES OF THE HUMANS

by:

Robert Kevin A. Alindayu
Teacher III, Mariveles National High School-Poblacion

The body of knowledge that surrounds the world mostly concerned with Science. Science is one of the learning areas that is very interesting to study and to deal with. Life revolves around Science and its concept and the processes involved. According to Meriam Webster Dictionary, Science is a body of knowledge which focuses on the study of the natural world based on facts acquired through experiments and observation. Indeed, Science affects people’s daily life activities. But how do people view Science?

Let us take a look on the view of the preschool children. For five-year old kids, Science is an area that teaches them to identify their external body parts and its functions. It demonstrates how to move their bodies in the tune of a dance music. Science plays an important role in the children’s identification of their physical feature as human beings.

For elementary school students, Science is something that shows them how matter works through classifying things as solid, liquid, and gas. It gives clarity on the materials they see. It opens their minds on the non-living things and its benefits to humans. Science also shows how plants and animals are grouped and categorized and how they interact to people. It directs them on living organisms and how these God’s creatures work and interrelated to one another. Science displays how living organisms affect non-living organisms and vice versa.

For high school students, Science is a subject that presents the scientific method and how the procedure involved applied in an experiment or study. It lets teenagers to know how earth and other planets revolve around the sun that makes them differ from each other in day and night and climatic condition. Science teaches students to protect the environment and natural resources. It teaches them to conserve food, water, energy, and minerals. Students learn how chemical elements play an important role in engineering and medicine. Science teaches how electricity travels through wire to deliver energy to the household and establishments. It allows leaners to identify the basic stages in converting AC (Alternating Current) voltages into DC (Direct Current) voltages in a power supply to send energy to the loads like mini-drill, appliances and gadgets.

College students view Science as a course that teaches them how to work hard while preserving the ability to do the job. It teaches them the speed to finish any
specified task in a given period of time. It also teaches them to gain momentum while pursuing their dreams. The good thing about Science is that whenever they fall, they are taught to stand in order to recover and make another move. Science does not only teach students about the world and the organisms interacting in the environment, but it also teaches students the science of politics and how people dwell with issues and concerns in a community.

For doctors, Science gives them the opportunity to give life to a baby. It gives parents the chance to take care of their children. For businessmen, Science produces goods to sell and provides services to the customers. For a military personnel, Science gives them the direction. It is easy for them to find the target and accomplish the task.

Science is everywhere. All the material things that people are using were created with Science. People may view Science in different perspectives, but still it makes life more enjoyable. As Bachynski stated “Science affects everybody”.
