“SMAW” ISN’T IMPORTANT?

by:
Arnel Ayuban

Nowadays many inventions have evolved and have been created by several persons. One of these creations that was invented is the technology of welding. Although we have many types of welding process, let us focus only in shielded metal arc welding or SMAW. Do you believe it helps our society and our economy? It has been used for many years until now and it’s very useful in all steel and metal works industry, in all constructions and fabrication technology businesses. It is quite evident that it has grown so fast all over the world. You can see this mostly in building processes, joining of big I beam steels, high trusses in heavy steel industries through this welding machinery which makes our life easier and helps our economy grow more.

Through this simple and versatile machine, a welder can repair and maintain every metal craft in your homes, schools, companies and businesses. It is really a big help to our society as it brings many opportunities all over the world to make a change in every family. Welding is like life. You are joining the pieces of you as metal to be stronger and be successful someday, you weld the faces of your dreams until it is fulfilled. Using a welding rod or electrode that is consumable you don’t have to lose your temper and faith, just go on and it will be better if you continue on dreaming. Many kinds of arc welding have been invented like GTAW, GMAW, FCAW, MIG, TIG and many more. And by this I define welding as uniting, joining or fusion of pieces of metal, steel and more together by the use of electrical current with rod coated of flux, a chemical that burns to form weld.

This showed the significance of welding in this life and the importance in our community, society and economy. And to be well known all over the world in the near future.
