THE FATE OF PHILIPPINE EDUCATION

by:

Aira Joy I. Santos
Administrative Assistant III

Since the time the coming of scholastic foundations in the Philippines, our students have been hauling around extremely substantial course readings and note pads stored in their bag packs and storage spaces. During that time and to the disappointment of concerned guardians, kilos have pressed on as instructive educational plans created in unpredictability and modernity.

One of the most eminent achievements in the Philippine Education is that the administration effectively looks to extend access and cooperation in advanced education and, significantly more critically, attempts to improve the nature of instruction. On the opposite side, the past organizations K-12 changes have definitely prompted diminished pace of school enrollees, as well, in any event for the time being, since a considerable lot of the students that would for the most part have entered college after Grade 10 presently need to finish two extra long periods of school. Regardless of certain quandaries, subjective upgrades and accomplishments in the Philippine educational framework are yet prominent in various territories. This remembers a slight increment for the quantity of advanced education staff holding higher degrees. Regardless of the lack of trailblazers, specialists and information makers in the nation, it is incredible to take note of that Filipinos are for the most part organizing higher and propelled instruction. Truth be told, there have been a wide enthusiasm for worldwide training among Filipinos, just as nontraditional instructive courses outside of the regular school courses.
With the efforts of the local government, the advancements of local-educational institutions, corporate social-responsibility initiatives of corporations and the individual pursuits of Filipinos for personal empowerment through education, a rise on the number of innovators, researchers and knowledge producers in the country may not be a problem anymore in the near future. As a nation, we just have to redirect our focus in terms of continuously advocating higher education by supporting any efforts in the improvement of our educational system.

Individually, we just have to be more open to educational opportunities, and maximize our edge as English-speaking citizens, a major benefit in global commerce and education. Being more pro-active in teaching ourselves to be our own responsible innovators and knowledge producers for our own professional and financial gain. After all, as a nation, we are also very much into technology and the Internet. With research and a few clicks here and there, we might actually stumble on some local grants, interesting online courses and international scholarships that can upgrade us educationally and economically. Continuous learning and education, after all, are still the greatest investments we could give to ourselves.
