TICKLING ELECTRICITY AMONG THE COMMUNITY

by:
Walter M. Bantay
Teacher II, Balsik National High School

When things get muddy and electrified, seldom do we see people talking about the root cause of the root cause of the event. Things like being electrocuted are seldom discussed in homes and in the community, however in the school the knowledge like these are usually discussed, the difference between the line of knowledge and the line of the way to survive matters especially amidst the usual accidents which may cause individual experience a little injury or worst the loss of life.

Not only the awareness on the effects of electricity do people want to be active on, the energy that this electricity brings is also of great importance.

How do we consume the electricity may offer great relevance to the community, to our safety and also to the needs of the people next to us.

In a country like ours where the electric source must be paid in every single centavo, we must value the energy that we have, the electricity may actually bring us peace or destruction, the energy it possess must not be taken for granted.

The Afghanistan newspaper had indicated that “one of the most important needs of the present day economy and society is the energy without which not only the functioning of the economy suffers a lot but the taste and colour of the social life is greatly reduced.”

As teachers of the community, the thing that we must do is to assist and help the students and the common people achieve the development of the maximization of electricity at its finest and its full potential without awakening the danger of the electricity which is given to us.
