Ensuring quality education and fostering success to students is one of the main goals of an educator. But with the transition of generations, the task of teachers is now far more than the content of the course outline especially now that millennials are growing up in a different society that most of us are familiar with. With the passage of one generation to another, teachers are also undergoing the process of shifting from traditional to unconventional type of teaching.

Since millennials are the first ones to grow up in the digital age, instead of the usual lecture-based type of learning, teachers are now utilizing technology in order to gain the attention of students when teaching. From PowerPoint presentations to Video Clips, educators have found several ways in order to motivate, involve and encourage students in every class. Using different media also helps them understand students who are inclined in using technology in a daily basis.

According to Twigg (2002), incorporating technology into teaching helps in knowing what aspects of learning students should be enhanced and should only be used if it is for the amplification of quality education through technological advancement.

Moreover, Wilson (2004) stated that millennials are more participative and likes active learning. Students of this generation likes discussion, transfer of learnings from a situation to another, developing problem solving skill and intrapersonal communication. Furthermore, he discussed that children learn better by engaging with the actual learning material than listening on lectures and memorizing terminologies as they relate them to their own experiences and apply them to practical situations.
Students who are part of Generation Y are also more challenging. They tend to be more inquisitive of things and will ask questions more often in order to satisfy their queries. They dislike superficial explanation and would rather hear complex clarification if it means they would get the level of knowledge they want.

Also, millennials have different ways of learning and they express themselves differently. This is why teachers tend to have variety of teaching strategy for every class. They are encouraged to develop a learning strategy that will help students be flexible as well as it helps them to be the most effective in different situations that will enhance the educational attainment of the students.

Even though there seem to be a generation gap between most teachers and the millennial students, these educators still try to do their best and give what they have just to assure that students are getting the best education they can have.
