Wherever we go, we are inundated with communication. By the spoken word, we communicate with the people we meet, the people we speak with on the phone and even the people on the radio, the television and the movies. But those are just small portion of communication we face every day. We also communicate with other people by means of writing. Everything that we read, wherever we read it, is considered as communication. And yes, endless possibilities and means of communication that exist online!

However, according to studies, not everyone responds the same manner to communication. Some people are more responsive to communication than others, and these people tend to become more informed somehow end up more successful. Some ignore most of communication. And these people are the ones who missing-out on a great and better way of personal growth.

In education, communication is one major key – to learn and teach. If you are planning to make the most of it, one thing you have to bear in mind is to be open-minded. Whatever forms anyone is trying to communicate with you, you have to be able to receive that input. If someone is speaking with you, listen. If you are reading something, see well trough it. Most importantly, have an open-minded all the time. Absorb all the details that you get, and try to retain as much of it as you can.
It’ll be easier for you to do this effectively by intensifying your input channels and downplaying your output ones. In verbal communication, the manageable way to do this is to listen more and talk less. When you listen more, you are inputting information into your brain, and you are not spending more energy by talking, which is a form of output information. And when you read, the significance of communication is input. Wherefore, reading is a very important skill that is needed in child’s education—it is an almost 100% form of knowledge and information input, unlike other forms of communication that exist.
