UNVEILING THE NEW DIMENSION OF TEACHING

By:
IVAN GAIL R. YARRA
Teacher III

The philosophy of teaching can be defined as a body of principles underlying a specific branch of learning. Teaching affects the lives of the students. There will be no learning if your students do not become successful in the future. At the end of the day teachers are the main ingredients to make the life of the students successful. Believing in the mantra that if teachers do not motivate the students properly to study hard, learning will not be achieved.

It is then a great call on the part of a classroom teacher to create a wholesome atmosphere on the class and generate a positive approach and learners must participate actively to make the teaching and learning process effective and efficient.

Considering the following techniques in teaching may help the teachers to improve the teaching and learning process in their respective classroom.

a. Teaching starts where the student is. As a teacher you need to consider the ability of each learner to know their strengths and weaknesses. From that point of view you will know what their ability is. It needs a constant effort and reminder to encourage them to improve themselves.

b. Be Firm. Command a respect to your students. In terms of decision making you need to be constant and believable because sooner or later the class will notice if you are consistent or not. Being very strict sometimes or becoming relax thus confuse the learners.
c. Be Smart and Confident. Make sure that every time you go in class you are prepared because if not learners may think that they are smarter than you especially this time when they can easily learn things thru online references. You need that confidence to convince them. Moreover, you need to give them accurate and precise facts to unlearn things from them.

c. Be Flexible. You need to be resourceful. Teaching does not stop with paper and pencil test. You need to give them real and factual scenario so that teaching will not be boring and give example that learners can relate with it so that they can share their own experiences.

d. Plan your work and work your plan. If you plan all the things that you are going to share to your learners, everything will go smoothly. The more prepared you are, the more relaxed and resilient you will be. It is important for us teachers to remember that we must provide quality education. Walk your talk is then a great step for learning.

The gift of teaching is a peculiar talent, and implies a need and a desire to the teacher himself. In order for the education to be effective we teachers need to be flexible and innovative to offer new dimensions in the teaching and learning process.
