USING TECHNOLOGY IN CLASSROOM

by:

Marvin Y. Lindog

Teacher III, Tipo Elementary School

Most of the teachers use technology in their teaching profession. Technology makes the work easier for them like making school reports, computing grades and as a medium of instruction. It helps the learners to understand clearly the lessons. It improves the learners’ performance because they assist them to become more engaged learners.

“Teachers are learning how to teach with emerging technologies (tablets, iPads, Smart Boards, digital cameras, computers), while students are using advanced technology to shape how they learn.” (Cox, 2015). Teachers need to have a proper planning. They must clasp technology to create a cooperative learning environment. They become facilitators and guides to the learners and let them use technology to see what kind of solutions that they will do to the different problems. By doing this, learners become more creative and they can learn by doing. It is not only used as the drawing tool, calculator or film projector for them.

For some of the teachers, it is quite difficult and confusing because some of the learners do not have a technology like computers at home. In addition, some of the teachers have a lack of knowledge of the computer. Learners only depend on the school where they have the opportunity to apply technology to their learning. Therefore, to solve these problems, the school and the community must have a helping hand to help the economically disadvantage learners for their success and to become more productive citizens of our country.

With the advent of technology advancement, our pupils must be prepared as well in this globally competitive society. They should be exposed to a kind of technology that is very useful especially in teaching and learning process. You may utilize the community resources like those who have the knowledge in the Information Technology and educate yourself in the use of technology inside the classroom for effective teaching and learning process.
