WASTE MANAGEMENT

by:

Rose Ann B. Guintu

People need to think if “waste” is indeed a waste. It is a rethinking that calls for waste to turn to something new and useful. The problems in waste can be lessened through the help of people in the community and private sector, involving technologies and disposal methods on the other hand, awareness of people about waste management could be a big help to reduce the waste in the community.

The human population continues to grow which requires industries to fulfill the basic needs of human for comfortable living, which cause wastes from domestic and industrial activities dumped into the environment. Recycling is one way to manage the waste, it is an effective method of lessening waste without harming the environment. It can also help in lessening the use of raw materials and energy required to produce new products.

Nowadays, people were already doing something about waste management, for instance the plastic beverage bottles are flexible, transparent and food safe. These bottles are recyclables, it can be made to a cute plant box, lake boat, pencil or marker organizers and a lot more. Paper is a biodegradable material, when it goes to landfill, as it rots it produces methane, which is a potent greenhouse gas which contributes in increasing global warming. Used wheels can also serve as plant box in this way used wheels can still be used and help to avoid the increasing number of mosquitoes.

In our own simple way, we can help in waste management, even though it is a simple way but for sure it can contribute a lot in our environment. It can also encourage other people to help in creating new things from a waste, it can also serve as income to other people. Helping our environment is also a mean to help our future generations to have a safe environment to live in.
