WASTE MANAGEMENT……. HELPS US A LOT

by:
Raquel S. Calma
Master Teacher I, Sisiman Elementary School

Wastes……wastes…. We always hear and see it in our school. For as long as man exist, his needs to satisfy, his desires and wants, science and technology treat man as socio-economic being, wastes will still around.

As time goes by, technology brings a new one to us. New things that we want to have it. A desire to acquire it, to satisfy ourselves, but did we ask ourselves if we really needs the new one. What we will do to the old one? Dispose….Throw or give it to others… The mentally that the Filipino has. They didn’t realize that this existence is now being threatened by air pollution, water contamination, and land erosion emanating from wastes generate by industries, by improper waste disposal practices. The fact remains, that man has gradually degraded the environment-air, water and land where he lives and sooner or later will be and endangered species.

The time to act is now. Manage our waste. Waste Management is the collection, transportation, and disposal of garbage, sewage, and other waste products.

It is a learning experience that begins with us by educating, planning, recycling, monitoring and following up. Education tells us that by planting trees, the effect to polluted air on man and animals can be minimized because it can absorb and neutralize toxic gases. Trees give off oxygen, the element essential in the air we breathe and the one that keeps the air fresh and clean. Trees absorb water from rainfall and prevent soil erosion. Planning tells us that manufacturing sites and garbage dumps must be located in areas away from homes and residential centers. Dust interceptors and waste water treatment facilities must be installed in every manufacturing plant; refuse and debris can be mixed with animal waste and manure to make compost and organic fertilizer.
Old newspapers, aluminum containers and some plastics materials can be recycled. Monitoring informs us that the quality of air we breathe and the water we take in can be safeguarded through community cooperation and action by reporting pollution sources and offender to proper authorities. Finally, following up tells us that waste management is a continuous improvement process designed to protect the environment and improve the quality of our lives.

IT IS NOT THE END OF THE WORLD. We can still survive in global warming that we experience now. Let us take time by planting trees in our backyard. Teach our pupils to plants trees, to have time to love our nature. By doing this we will make us feel healthier, better and more responsible individuals to our world.
