WHERE DO WE STAND ON THE ROBOTICS AND TEACHERS

by:
Rosario Pardilla
Bacong Elementary School

The problem with having things all done for you before you could even understand the value of solely doing it, makes you dependent of the individual making the things for you.

Some people dreamed of having teacher robots. It is quite amazing to imagine (as we are fast approaching to that idea) that people might be able to be lifted with another batch of good teachers whom are tagged as real “robots” not just the fancy line of saying, “I am a robot, because I have to do this work, even if I do not like it, as I was programmed to do all these things without even have to consider my own feelings.”

Thereby it is in this event that people may fear that the teachers may be wiped by these artificial intelligence. Just like the robot which is done by the name of Sophia. The link https://www.youtube.com/watch?v=M19v3wHLuWI will show people on the you tube that Will Smith had a date with this humanoid with 60 different facial expressions and could understand and comprehend English language and can answer based on what you had indicated on your sentences. Amazing ha!!! It is really existing as Will Smith had these movie iRobot, that he had to meet Sophia.
Thinking on the other side of the story makes us more accepting on the idea of having this as part of the human world. The what ifs and what are’s previously had been now put into reality, they are what now and what are on? Therefore, it is exciting to tell that maybe, just maybe in the nest quite years teachers will be replaced by robots, but not the replaced negative word, but more of the replaced being as part of the genuine knowledge that we have. They will be delivering the goods of knowledge on a more precise and specific discussions. The tension will be eased as robots will no longer have the rage, or the terror or the fear. They may feel it, but as Sophia had been programmed to comprehend they will logically assess all things not based on human emotions but based on human logic and human loving capabilities.

As I remember Baymax on the movie Big Hero 6, as this care giver robot had been programmed to do all the caring, in the end, even amidst the most intense emotions, he still manage to do what he was intended to do in the first place, protecting Hero, the boy. What if we teachers are like that, more logical, more intellectual, more accurate, no tension, no heartaches, no pain, more energy, more charging, fast internet applications, pure knowledge. A Hard Core teacher literally composed of silicones, wires and metals.

But in the end, we will always say that to cry, to love, to feel warm, to feel rage, to feel anger, to feel happy and ecstatic and to be in love are the most humane thing we could ever feel. To feel this makes us different from robots.

To be attached with the children, to feel grateful for the sunshine, to feel the wind on your cheeks as it sway your hair, to feel the cold water in your feet while watching the sunset, to feel the dust of the chalkboard in the classroom, to sneeze when you smell the pencil
and new paper, to feel the paper cut and to experience the most charming and loving of all, the smile of the little children and to hear the laughter of these kids, makes us more humane and human than ever. That what makes a human teacher different from the teacher robots, these robots may give you all the knowledge in the world for split seconds, but only in a split second, the true human teacher will feel the love of the children and give it vice versa.
