WHY KNOWLEDGE MANAGEMENT IS IMPORTANT IN PHILIPPINE EDUCATION

by:
Maria Corazon M. Alarcon
Head Teacher III, Sabatan, Elementary School

Knowledge Management (KM) is an efficient way of file sharing, creating and storing of organization’s information, which is highly essential especially in the field of education.

KM is often being missed out as an effective discipline in the education sector even though it is established in 1991. People often forget that this discipline is the key to continuous improvement.

This discipline also aims to produce innovative strategy, sharing of best practices and lessons learned and an advantage to both learners and faculty as this can be a baseline of the upcoming strategy and tactics of the government regardless of the component. This discipline encapsulates the organization’s next steps to reach the goals and push its members to its full potential since data are already available.

Challenges and opportunities that KM gives to the education sector only proves that this is integral in coming up with new solutions in the problems in the education sector. Drive for information and knowledge is necessary, as well, to keep up with neighboring countries, which are not only excelling in Science and Technology but also Humanities.

Department of Education (DepEd) should already drive this not only in the national level but also to the district level as this can also provide necessary solutions to some of the problems in the community and everyone can be aligned.
As they say, KM also bridges people, process, and technology, enough to say that the said government agency should start establishing such tool for the organization’s future to use and share information effectively.
